Attempt : 1
Total Mark : 40
Marks Obtained : 40

Section 1 : Coding

1. Problem Statement

Write a program to obtain the start time and end time for the stage event show. If the user enters a different format other than specified, an exception occurs and the program is interrupted. To avoid that, handle the exception and prompt the user to enter the right format as specified.

Start time and end time should be in the format 'YYYY-MM-DD HH:MM:SS'If the input is in the above format, print the start time and end time.If the input does not follow the above format, print "Event time is not in the format "

Input Format

The first line of input consists of the start time of the event.

The second line of the input consists of the end time of the event.

Output Format

If the input is in the given format, print the start time and end time.

If the input does not follow the given format, print "Event time is not in the format".

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 2022-01-12 06:10:00
2022-02-12 10:10:12
Output: 2022-01-12 06:10:00
2022-02-12 10:10:12

Answer

```
# You are using Python
from datetime import datetime

start_time = input().strip()
end_time = input().strip()

try:
    datetime.strptime(start_time, '%Y-%m-%d %H:%M:%S')
    datetime.strptime(end_time, '%Y-%m-%d %H:%M:%S')
    print(start_time)
    print(end_time)
except ValueError:
    print("Event time is not in the format")
```

Status : Correct ***Marks : 10/10***

2. Problem Statement

Alex is creating an account and needs to set up a password. The program prompts Alex to enter their name, mobile number, chosen username, and desired password. Password validation criteria include:

Length between 10 and 20 characters.At least one digit.At least one special character from !@#$%^&* set. Display "Valid Password" if criteria are met; otherwise, raise an exception with an appropriate error message.

Input Format

The first line of the input consists of the name as a string.

The second line of the input consists of the mobile number as a string.

The third line of the input consists of the username as a string.

The fourth line of the input consists of the password as a string.

Output Format

If the password is valid (meets all the criteria), it will print "Valid Password"

If the password is weak (fails any one or more criteria), it will print an error message accordingly.

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: John
9874563210
john
john1#nhoj
Output: Valid Password

Answer

```
name = input().strip()
mobile = input().strip()
username = input().strip()
password = input().strip()

special_chars = set("!@#$%^&*")

try:
```

```
    if len(password) < 10 or len(password) > 20:
        raise Exception("Should be a minimum of 10 characters and a maximum of
20 characters")
    if not any(ch.isdigit() for ch in password):
        raise Exception("Should contain at least one digit")
    if not any(ch in special_chars for ch in password):
        raise Exception("It should contain at least one special character")
    print("Valid Password")
except Exception as e:
    print(e)
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Write a program to read the Register Number and Mobile Number of a student. Create user-defined exception and handle the following:

If the Register Number does not contain exactly 9 characters in the specified format(2 numbers followed by 3 characters followed by 4 numbers) or if the Mobile Number does not contain exactly 10 characters, throw an IllegalArgumentException. If the Mobile Number contains any character other than a digit, raise a NumberFormatException.If the Register Number contains any character other than digits and alphabets, throw a NoSuchElementException.If they are valid, print the message ‘valid’ or else print an Invalid message.

Input Format

The first line of the input consists of a string representing the Register number.

The second line of the input consists of a string representing the Mobile number.

Output Format

The output should display any one of the following messages:

If both numbers are valid, print "Valid".

If an exception is raised, print "Invalid with exception message: ", followed by the specific exception message.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 19ABC1001
9949596920

Output: Valid

Answer

```
class IllegalArgumentException(Exception):
    pass

class NumberFormatException(Exception):
    pass

class NoSuchElementException(Exception):
    pass

def validate_register_number(reg_no):
    if len(reg_no) != 9:
        raise IllegalArgumentException("Register Number should have exactly 9 characters.")

    if not reg_no.isalnum():
        raise NoSuchElementException("Register Number should only contain alphabets and digits.")

    if not (reg_no[0:2].isdigit() and reg_no[2:5].isalpha() and reg_no[5:9].isdigit()):
        raise IllegalArgumentException("Register Number should have the format: 2 numbers, 3 characters, and 4 numbers.")

def validate_mobile_number(mobile_no):
    if len(mobile_no) != 10:
        raise IllegalArgumentException("Mobile Number should have exactly 10 characters.")
    if not mobile_no.isdigit():
        raise NumberFormatException("Mobile Number should only contain digits.")

try:
    reg_no = input().strip()
```

```
    mobile_no = input().strip()

    validate_register_number(reg_no)
    validate_mobile_number(mobile_no)

    print("Valid")

except (IllegalArgumentException, NumberFormatException,
NoSuchElementException) as e:
    print("Invalid with exception message:", e)
```

Status : Correct **Marks : 10/10**

4. Problem Statement

In the enchanted realm of Academia, you, the Academic Alchemist, are bestowed with a magical quill and a parchment to weave the grades of aspiring students into a tapestry of academic brilliance.

The mission is to craft a Python program that empowers faculty members to enter student grades for any two subjects, stores these magical grades in a mystical file, and then, with a wave of your virtual wand, calculates the GPA to unveil the true essence of academic achievement.

Input Format

The input format is a string representing the student's name, any two subjects, and corresponding grades.

After entering grades, they can type 'done' when prompted for the student's name.

Output Format

The output should display the (average of grades) calculated GPA with a precision of two decimal places.

The magical grades will be saved in a mystical file named "magical_grades.txt".

Refer to the sample output for format specifications.

Sample Test Case

Input: Alice
Math
95
English
88
done

Output: 91.50

Answer

```
# You are using Python
total_grades = 0
count = 0

with open("magical_grades.txt", "w") as file:
    while True:
        name = input().strip()
        if name.lower() == "done":
            break
        subject1 = input().strip()
        grade1 = int(input().strip())
        subject2 = input().strip()
        grade2 = int(input().strip())

        # Write to file
        file.write(f"{name} {subject1} {grade1} {subject2} {grade2}\n")

        # Accumulate grades
        total_grades += grade1 + grade2
        count += 2

if count > 0:
    gpa = total_grades / count
    print(f"{gpa:.2f}")
else:
    print("0.00")
```

Status : Correct ***Marks : 10/10***
